

citemsp — Full Feature Sandbox

1. Plain citations and range compression

`\cite` baseline (5 consecutive): [1–5]

`\citemsp` same keys: [1–5]

Non-consecutive (`\cite`): [1–3, 5–7]

Non-consecutive (`\citemsp`): [1–3, 5–7]

All ten: [1–10]

Single: [3]

2. Default locators: section (§) and paragraph (¶)

Section only: [3^{§6.1}]

Section + paragraph: [3_{¶2}^{§6.1}]

Paragraph only (sub slot): [3_{¶5}]

Nested section number: [3^{§3.2.1}]

Deep subsection + para: [3_{¶4}^{§3.2.1}]

3. Built-in prefix locators

Each built-in prefix in both the superscript and subscript slots:

Prefix	Type	In super slot	In sub slot
b (box)	□	[5 ^{□21.1}]	[5 _{□21.1} ^{§8.4}]
d (definition)	△	[3 ^{△5}]	[3 _{△5} ^{§3.2}]
e (equation)	eq.	[3 ^{eq.4.3}]	[3 _{eq.4.3} ^{§3.2}]
f (figure)	▣	[3 ^{▣3}]	[3 _{▣3} ^{§6.1}]
n (footnote)	†	[4 ^{†7}]	[4 _{†7} ^{§1}]
p (page)	pp.	[3 ^{pp.42}]	[3 _{pp.42} ^{§3.2}]
t (table)	▤	[5 ^{▤2}]	[5 _{▤2} ^{§8.4}]

4. Custom user-registered prefixes

Registered with `\citemspprefix` in the preamble:

Prefix	Type	Output
T (theorem)	Thm.	[3 ^{Thm.4.2}]
L (lemma)	Lem.	[3 _{Lem.1} ^{§3.2}]
C (corollary)	Cor.	[3 ^{Cor.3}]
A (appendix)	App.	[3 ^{App.2}]
w (widget)	w.	[5 ^{w.7}]

Custom + default mixed: [3_{eq.3.1}^{Thm.4.2}]

5. Mixed locator types in a single call

`\citemsp{ref3/6.1/2, ref5/b21.1, ref4/1/e4.3}`

Output: [3_{¶2}^{§6.1}, 4_{eq.4.3}^{§1}, 5^{□21.1}]

`\citemsp{ref3/T4.2, ref1/3.2/d5, ref5/8.4/t2, ref7/p42}`

Output: [1_{△5}^{§3.2}, 3^{Thm.4.2}, 5_{▤2}^{§8.4}, 7^{pp.42}]

6. Range compression with mixed entries

Range then locator: $[1-3, 4^{\S 3.2}]$

Locator then range: $[1^{\S 3.2}, 2-5]$

Plain, locator, range: $[1, 2^{\S 3.2}, 3-5]$

Range, locator, range: $[1-3, 4^{\text{eq. 2.1}}, 5-7]$

Two locators between ranges: $[1-3, 4^{\S 3.1}, 5^{\square 2.3}, 6-8]$

Adjacent locators only: $[3^{\S 3.1}, 4^{\text{eq. 2.1}}, 5^{\square 4.2}]$

7. Italic context (automatic kern adjustment)

Upright: The field equations $[3^{\S 3.2}_{\text{eq. 4.3}}]$ can be derived from a variational principle.

Italic: Hawking radiation $[4^{\S 1}_{\text{eq. 2}}]$ implies black holes are not truly black.

Italic with prefix: The stress-energy tensor $[5^{\square 21.1}]$ is discussed in a self-contained box.

Italic with stacked locators: See $[3^{\S 6.1}_{\text{eq. 4.3}}]$ for the derivation.

8. Scaling: `\citemspscale`

Default scale (0.35): $[3^{\S 6.1}_{\text{eq. 4.3}}]$

Smaller (0.25): $[3^{\S 6.1}_{\text{eq. 4.3}}]$

Larger (0.50): $[3^{\S 6.1}_{\text{eq. 4.3}}]$

9. Drop-in `\cite` replacement

`\citemsp` with no slashes behaves like `\cite`:

`\cite{ref3}` $\longrightarrow$ $[3]$

`\citemsp{ref3}` $\longrightarrow$ $[3]$

`\cite{ref1,ref2,ref3,ref4,ref5}` $\longrightarrow$ $[1-5]$

`\citemsp{ref1, ref2, ref3, ref4, ref5}` $\longrightarrow$ $[1-5]$

10. Realistic usage in running text

The Schwarzschild solution $[2^{\S 1}_{\text{eq. 3}}]$ was found shortly after the field equations $[1]$ were published. A modern treatment can be found in standard textbooks $[3^{\S 6.1}_{\text{eq. 2}}, 5^{\square 21.1}]$, where the derivation proceeds via the Birkhoff theorem $[3^{\text{Thm. 6.2}}]$. The singularity theorems $[4^{\S 1}_{\text{eq. 4.3}}, 6]$ later showed that gravitational collapse is generic. For further context see $[7-10]$.
